INSTALLATION ............................................................................................................................................................. 83

28/01/2020 3
Methodology:
This document is intended for manufacturers of machines that incorporate Poclain Hydraulics products. It describes the technical characteristics of Poclain Hydraulics products and specifies installation conditions that will ensure optimum operation.
This document includes important comments concerning safety. They are indicated in the following way:

- **Safety comment.**

This document also includes essential operating instructions for the product and general information. These are indicated in the following way:

- **Essential instructions.**
- **General information.**
- **Information on the model number.**
- **Weight of component without oil.**
- **Volume of oil.**
- **Units.**
- **Tightening torque.**
- **Screws.**
- **Information intended for Poclain-Hydraulics personnel.**

The views in this document are created using metric standards.
The dimensional data is given in mm and in inches (inches are given in brackets in italic).
Applications
VB3-002 reverse modulator is a mechanically-controlled, three-way, graduated release pressure reducing valve. VB3-002 valve is used for precision dosing of the output pressure (at F) proportionally to the control stroke. It is controlled via lever or pedal. Lever is usually used for controlling the parking brake (spring applied hydraulic release brake). Pedal is usually used for inching control.

Operation
When the control is idle, the output pressure (at F) is limited to the preset pressure of the valve, irrespectively of the supply pressure. When the lever or pedal is activated, the output pressure (at F) falls in proportion to the angular position of the control.

• Lever control:
  When the lever is in its maximum position (locked), the output pressure (at F) is zero. The control lever can be unlocked using the pushbutton (horizontal lever) or the collar (vertical lever).

• Pedal control:
  When the pedal is fully depressed, the output pressure (at F) is zero.

**Limitations**
- Pressure rise: < 1 bar [14.5 PSI] / ms
- Current: min. 100 mA to assure contact
  - max. 4 A for Resistor load
  - max. 2.5 A for Inductive load
- Voltage: max. 42 V
**Applications**
The VB-00E is a reverse modulating electrically or electrically/manually operated brake valve for Spring Applied Hydraulically Released (SAHR) brake. The VB-00E brake valve is a 3-way / 2-position electro-valve and includes a pressure reducing valve as well as selector.

**Operation**
When valve is not operated, output pressure (X) is limited to the preset max. pressure of the valve independently from the input pressure.

VB-00E has two principles of operation:

1. **Electric actuation**
   - VB-00E has fixed output pressure preset by the pressure reducing valve. When the VB-00E is not actuated (when electric control =0) the output (X) is directly connected to the tank (T) and provide a pressure equal to zero; SAHR brake is applied. When VB-00E is electrically actuated (electric control =1) the output (X) is connected to the output of the pressure reducing valve; VB-00E provides the preset fixed pressure; SAHR brake is released.

2. **Electric with mechanical actuation**
   - In this configuration, the pressure reducing valve provides an output pressure proportional to the mechanical command position.
   - When VB-00E is not actuated (when electric control=0) the output (X) is directly connected to the tank (T) and provide a pressure equal to 0; SAHR brake is applied.
   - When is electrically actuated (when electric control=1) the output (X) is connected to the output of the pressure reducing valve. Therefore, VB-00E supplies a precise output pressure inversely proportional to the mechanical command stroke: the output pressure (X) decreases from the max. preset pressure (control released, brake released) to 0 (control actuated, brake applied).
## Overall dimensions of VB-00E brake valve

**VB-00M**

- Electric and manual park brake management
- 2015/68 compliant
- Dual circuit

**Applications**
The VB-00M is fail-safe park brake management valve, designed to comply with the EU regulation 2015/68 for self-propelled AG machine equipped with spring applied hydraulically released (SAHR) park brake. It is an electrical ON/OFF valve with manual hand pump to release the park brake and tow the machine in case of breakdown.

**Operation**
The VB-00M has two principles of operation:

1. **Electric actuation (normal operation)**
   The VB-00M is operated by two solenoids with a spool detent assembly. It allows the change of spool position applying a short-time pulse. A pulse on “a” solenoid will release the park brake and a pulse on “b” solenoid will apply the brake.
   The valve is also available with single solenoid.

2. **Manual actuation (vehicle breakdown event)**
   Release of the brakes is achieved manually by pumping. Lock nut of the tap should be loosen and then fully closed. This allows towing a machine to the desired place for service. Tap needs to be kept opened to apply the brake and lock nut tightened. After the service the machine can be used normally again.

   **Do not remove rubber film placed over lever of the manual pump in normal operation. Remove it only in case of vehicle breakdown event.**

**Dedicated software**
The VB-00M is meant to be used with an ECU to achieve the right level of safety and be compliant with the 2015/68 regulation. The valve management “software component” is available with the Poclain Hydraulics range of ECU.

   **See technical catalogue N° A51874K for further information.**

Applications
VB3-010 modulating brake valve is a mechanically-controlled, three-way, graduated release pressure reducing valve. VB3-010 valve is used for the precision dosing of the output pressure (at F) proportionally to the angular displacement of the pedal, and therefore to the force applied to the pedal. This provides the feeling of braking.

In a braking circuit, VB3-010 is usually associated with the VB-100 single-circuit accumulator charging valve (or a VB-200 dual-circuit accumulator charging valve if VB3-010 is also associated with a VB3-002 emergency / parking brake valve).

Operation
When pedal is at rest (‘up’ position), the output pressure (at F) is zero and brake receptors are connected to tank (F to T).

When pedal is depressed, output pressure (at F) increases proportionally to the angular displacement of the pedal.

When pedal is fully depressed, output pressure (at F) is limited to the preset pressure of the valve irrespective of the supply pressure.

Applications
VB3-020 service brake valve (VB-0E0 and VB-0F0) is a mechanically-controlled, three-way, graduated release double pressure reducing valve. VB3-020 (VB-0E0 and VB-0F0) valve provides precisely controlled output pressures (at F1 and F2) proportional to the pedal stroke and therefore to the force applied to the pedal. This provides the feeling of braking.
In a braking circuit, VB3-020 (VB-0E0 and VB-0F0) is usually associated with VB-200 dual-circuit accumulator charging valve.

Operation
When pedal is at rest (‘up’ position), the output pressures (at F1 and F2) are zero and the brake receptors are connected to the tank (F1 and F2 to T).
When pedal is depressed, output pressures (at F1 and F2) increase proportionally to the angular displacement of the pedal. Output pressures (at F1 and F2) can be equal or different according to a ratio F2/F1 = 0.64 (VB-0E0) or 0.44 (VB-0F0).
When pedal is fully depressed, output pressures (at F1 and F2) are limited to the preset pressures of the valve irrespective of the supply pressure.
Pressures at F1 and F2 are strictly independent. A failure in one of the circuits does not affect the operation of the other circuit.

**VB3-012**

- Combination VB3-002 + VB3-010
- Single-circuit

---

**Applications**

VB3-012 brake control is a single-circuit braking assembly that combines:
- VB3-002 emergency / parking brake valve, which supplies an output pressure to control the automotive pump (inching),
- VB3-010 service brake valve, which supplies a pressure to control the service braking.

**Operation**

VB3-012 valve controls two independent pressures via a pedal. One pressure is for automotive pump control, and the other is for service braking control.

When operator presses pedal, VB3-012 supplies a pressure inversely proportional to the angular displacement of pedal to control the hydraulic pump.

If more braking is required, operator continues to press the pedal. VB3-012 then supplies an output pressure to the service brake in proportion to the angular displacement of the pedal.

** Limitations
Pressure rise < 1 bar [14.5 PSI] / ms
Current max. 4 A for Resistor load
max. 2.5 A for Inductive load
Voltage max. 42 V
Applications
VB3-022 brake control is a dual-circuit braking assembly combining:

- VB3-002 emergency / parking brake valve, which provides an output pressure to control the automotive pump (inching),
- VB3-020 service brake valve, which provides two output pressures, F1 and F2, for independent braking circuits.

Output pressures F1 and F2 can be equal (VB3-022) or different according to a ratio F2/F1 = 0.64 (VB3-0E2) or 0.44 (VB3-0F2).

Operation
VB3-022 controls three independent pressures via a pedal. One pressure controls the automotive pump, and the other two pressures control the service braking.

- **Two-step braking:**
  When the operator presses the pedal, VB3-022 supplies a pressure that is inversely proportional to the angular displacement of the pedal, to control the hydraulic pump. If more braking is required, the operator continues to press the pedal. VB-022 then supplies an output pressure to the service brakes in proportion to the angular displacement of the pedal.

- **Simultaneous braking:**
  VB3-022, VB3-0E2 and VB3-0F2 simultaneously control the pump (hydrostatic braking) and the service braking (mechanical braking) for more aggressive dynamic braking.

Pressures at F1 and F2 are strictly independent. A failure in one of the circuits does not affect the operation of the other circuit.

**Applications**

VB-0B0 valve is a single circuit brake valve that provides dynamic service braking in road mode and steering-assist braking in field mode. VB-0B0 is actuated by two pedals, and supplies two independent brakes on rear axle. The VB-0B0 valve combines the following components in a single unit:

- A pressure reducer that supplies an output pressure proportional to the pedal stroke.
- Two circuit selectors, each one associated with one of the pedals of the VB-0B0.

**Operation**

VB-0B0 performs two types of braking:

- Left/right directional braking in field mode.
- Braking with equal power distribution in road mode.

- **Off-road mode:**
  VB-0B0 provides steering assistance for turning. In an off-road mode, the two pedals are actuated independently. When operator depresses either pedal, the pressure reducer and the selector associated with this pedal are actuated. VB-0B0 supplies a graduated release braking pressure exclusively to the service brakes associated with this pedal.

- **Road mode:**
  In a road mode, the two pedals are mechanically linked. When the operator depresses one pedal, the other one is driven, and so both selectors are actuated together. The VB-0B0 valve supplies an identical pressure to both brakes, proportional to the stroke of the pedals.

VB-0D0 valve is a double circuit brake valve that provides dynamic service braking in road mode and steering-assist braking in field mode.

Standard VB-0D0 product has dual slope characteristic and improved watertightness.

VB-0D0 is actuated by two pedals, and supplies three independent brakes (two on the rear axle and one in the front axle).

The VB-0D0 valve combines the following components in a single unit:

- A pressure reducer that supplies an output pressure proportional to the pedal stroke.
- Two circuit selectors, each one associated with one of the pedals of the VB-0D0.

Operation

VB-0D0 performs two types of braking:

- Off-road mode:
  VB-0D0 provides steering assistance for turning. In off-road mode, the two pedals are actuated independently. When the operator depresses either pedal, the pressure reducer and the selector associated with this pedal are actuated. VB-0D0 supplies a graduated release braking pressure exclusively to the service brakes associated with this pedal.

- Road mode:
  In road mode, the two pedals are mechanically linked. When the operator depresses one pedal, the other one is driven, and so both selectors are actuated together. The VB-0D0 valve supplies an identical pressure to all brakes, proportional to the stroke of the pedals.

Applications

VB-100 accumulator charging valve charges the accumulator(s) of a braking circuit and maintains its (their) pressure while supplying an auxiliary circuit.

In a braking circuit, valve VB-100 is associated with the VB-010 single-circuit service brake valve (or the VB-002 emergency/parking brake valve).

Operation

During accumulator charging phase, built-in divider taps a constant flow from the valve supply flow and diverts it to the accumulator. When accumulator reaches maximum (cut-out) pressure, charging stops, and the entire supply flow is directed to output S (auxiliary circuit or tank return).

When operator actuates the pedal, the pressure in accumulator drops. When minimum (cut-in) pressure is reached, the valve again charges the accumulator until it reaches cut-out pressure.

Applications
VB-200 accumulator charging valve charges the accumulators of a braking circuit and maintains their pressure while supplying an auxiliary circuit.

In a braking circuit, valve VB-200 is associated with the VB-020 dual-circuit service brake valve (or the VB-010 single-circuit service brake valve and the VB-002 emergency / parking brake valve).

Operation
During the accumulator charging phase, the built-in divider taps a constant flow from the valve supply flow and diverts it to the accumulators. When the accumulators reach maximum (cut-out) pressure, charging stops, and the entire supply flow is directed to output S (auxiliary circuit or tank return).

When the operator actuates the pedal, the pressure in the accumulators drops. When minimum (cut-in) pressure is reached in at least one accumulator, the valve recharges the accumulators to cut-out pressure.

When a failure occurs in one of the braking circuits, the other circuit is immediately isolated by its safety valve. The circuit that remains operative can then be used as an emergency brake thanks to the energy stored in its accumulator.

**Applications**

VB-110 modulating brake valve is a mechanically-controlled, three-way, graduated release pressure reducing valve. VB-110 braking assembly contains the following components in a single manifold:

- A single-circuit accumulator charging valve,
- A mechanically controlled single-circuit service brake valve.

The incorporation of these functions in a compact unit reduces the risk of leaks and makes the overall size more compact.

**Operation**

During the accumulator charging phase, a built-in divider taps a constant flow from the valve supply flow and diverts it to the accumulator. When accumulator reaches maximum (cut-out) pressure, charging stops, and the entire supply flow is directed to output S (auxiliary circuit or tank return).

When operator actuates the pedal, the pressure in the accumulator drops. When minimum (cut-in) pressure is reached, the valve recharges the accumulator to cut-out pressure.

VB-110 is used for the precision dosing of the output pressure (at F) proportionally to the angular displacement of the pedal, and therefore to the force applied to the pedal.

This provides the feeling of braking. When pedal is at rest (‘up’ position), the output pressure (at F) is zero and brake receptors are connected to the tank (F to T).

When pedal is depressed, the output pressure (at F) increases proportionally to the angular displacement of the pedal.

When pedal is fully depressed, the output pressure (at F) is limited to the preset pressure of the valve irrespectively of the supply pressure.

Applications

VB-220 service brake valve is a mechanically-controlled, three-way, graduated release dual pressure reducing valve. The Poclain Hydraulics VB-220 braking assembly contains the following components in a single manifold:

- A dual-circuit accumulator charging valve,
- A mechanically controlled dual-circuit service brake valve,
- Two isolating valves for the braking circuits.

The output pressures (at F1 and F2), for the braking circuits, can be equal or different according to a ratio \( F2/F1 = 0.64 \) (VB-2E0) or 0.44 (VB-2F0).

The incorporation of these functions in a compact unit reduces the risk of leaks and makes the overall size more compact.

Operation

During the accumulator charging phase, the built-in divider taps a constant flow from the valve supply flow and diverts it to the accumulator. When the accumulator reaches maximum (cut-out) pressure, charging stops, and the entire supply flow is directed to output S (auxiliary circuit or tank return).

When the operator actuates the pedal, the pressure in the accumulator drops. When minimum (cut-in) pressure is reached, the valve recharges the accumulator to cut-out pressure. It is used for the precision dosing of the output pressures (at F1 and F2) proportionally to the angular displacement of the pedal, and therefore to the force applied to the pedal. This provides a feeling of braking. When the pedal is at rest (‘up’ position), the output pressures (at F1 and F2) are zero and the brake receptors are connected to the tank (F1 and F2 to T).

When the pedal is depressed, the output pressures (at F1 and F2) increase proportionally to the angular displacement of the pedal. When the pedal is fully depressed, the output pressures (at F1 and F2) are limited to the preset pressure of the valve irrespective of the supply pressure. When a failure occurs in one of the braking circuits, the other circuit is immediately isolated by its safety valve. The circuit that remains operative can then be used as an emergency brake thanks to the energy stored in its accumulator.

Applications

The service brake valve is a mechanically-controlled, three-way, graduated release dual pressure reducing valve. VB-22E braking assembly contains the following components in a single manifold:

- A dual-circuit accumulator charging valve,
- A mechanically controlled dual-circuit service brake valve,
- An electrically controlled parking brake valve,
- Two isolating valves for the braking circuits.

The incorporation of these functions in a compact unit reduces the risk of leaks and makes the overall size more compact.

Operation

During the accumulator charging phase, the built-in divider taps a constant flow from the valve supply flow and diverts it to the accumulators. When the accumulators reach maximum (cut-out) pressure, charging stops, and the entire supply flow is directed to output S (auxiliary circuit or tank return).

Each time the operator actuates the pedal, the pressure in the accumulator drops. When minimum (cut-in) pressure is reached in at least one accumulator, the valve recharges the accumulators to cut-out pressure, and so on.

VB-22E is used for the precision dosing of the output pressures (at F1 and F2) proportionally to the angular displacement of the pedal, and therefore to the force applied to the pedal. This provides the feeling of braking. When the pedal is at rest (‘up’ position), the output pressures (at F1 and F2) are zero and the brake receptors are connected to the tank (F1 and F2 to T). When the pedal is depressed, the output pressures (at F1 and F2) increase proportionally to the angular displacement of the pedal. When the pedal is fully depressed, the output pressures (at F1 and F2) are limited to the preset pressure of the valve irrespective of the supply pressure.

When a failure occurs in one of the braking circuits, the other circuit is immediately isolated by its safety valve. The circuit that remains operative can then be used as an emergency brake thanks to the energy stored in its accumulator. The parking brake valve has on/off solenoid control.

VS

- 70 l/min [18.5 GPM]
- Simple and Dual circuit (Single VS valve per line)

**Applications**

VS Valve is designed for applications with long brake lines or very large brake cylinder volume, requiring high flow 70 l/min [18.5 GPM].

VS Valve is a 3-way valve with an external hydraulic control. It supplies and drains high volume brakes by connecting accumulator to service brakes on large machines.

Main use: braking systems.

**Operation**

VS valve is normally used with full power brake as "Relay Valve" and with parking brake as "Quick Return Valve".

**VS as Relay Valve:**
Control pressure (F1 & F2) is supplied to the VS valve proportionaly to brake pedal angle on full power brake valve (VB-220). VS relay valve provides high flow directly from the accumulators (A1 & A2) to the brakes, proportional to the control pressure, i.e. directly proportional to the pedal position. The braking is progressive. As soon as brake pedal is released, VS transfers oil from brakes to the tank (T).

- External hydraulic pilot.
- Located between the accumulator(s) and the brake(s).
- Controlled and used with a modulating brake valve.

**VS as Quick Return Valve:**

The VS quick return valve transfers the flow coming from the brakes to the tank (T) proportional to the control pressure, i.e. directly proportional to the SAHR actuation. The braking is progressive.

- Internal hydraulic pilot.
- Located between the Spring Applied Hydraulically Released (SAHR) brake(s) and the tank.
- Controlled by and used with VB-002.
# VS Relay Valve

Pressure drop $P \rightarrow U$

[Graphs showing pressure drop characteristics for $U \rightarrow T$ and $P \rightarrow U$]
OPTIONS

1 Special calibration
Pressure (braking, pressure switch, etc.) or specific flow rate.

2 Specific port
Without changing the standard of the other ports.

3 Customized component
Installation of a non-standard component (potentiometric sensor, special pressure switch, etc.)

4 Mechanical control adaptation

Please contact your Poclain Hydraulics application engineer for further information on Options 1 through 4.

5 LS Port (for VB-100, VB-200, VB-110 and VB-220)
The Load Sensing port (M14x1.5 or 9/16-18 UNF-2B) is created on request on the standard valve body.

6 Isolating ball valves (for VB-100, VB-200, VB-110, VB-220)
In the event of failure of one of the braking circuits, this function acts in a similar way to isolating spool valves by keeping an energy reserve in the accumulator of the non-faulty circuit (limited reserve in the accumulator) and does not maintain pressure in the S line when a circuit has failed (if the steering is fed by the S port of the valve, choose spool valves).

Example of a VB-200 assembly:

Ball valve

6 Additional check valve (for VB-00M)

7 Two-slope spring mechanism (for VB-0B0 and VB-0D0)
For certain applications, the braking sensation, the ergonomics of the pedal board, and the overall performance of the braked vehicle require a special braking curve. The first part, with its gradual slope, provides gentle, progressive braking to slow the vehicle. The second part, with a steeper slope, provides a braking finish that is progressive but firmer, for emergency braking. According to the shape of the pedal, the user's impression can be similar to a master cylinder. Please ask us about the available pressures.

8 Pressure sensor
The sensor (refer to mobile electronics catalog No. A01888C) is installed on the MF port (single-circuit valves) or the MF1 port (dual-circuit valve). It sends a pressure signal to the electronic circuit in the form of an electrical signal that is proportional to the pressure. It can also replace the MF pressure switch in its stop light control function.
Pedal back abutment

Prevents the pedal from tilting backward when the floor is inclined.

Improved watertightness (for VB only. At VB3 this is standard and not an option.)

There is a version of the spring mechanism with internal drainage via the brake tank return line for applications in harsh conditions (high humidity, exposed valve, etc.). It is mandatory for open-cabin applications.

Circuit pressurization

MS Port (for VB-100, VB-200, VB-110 and VB-220)

The MS port (12 x 1.5) is added on request to the standard valve body. It is normally used for the installation of the MS pressure switch.

Additional check valve (for VB3-002)

Shuttle valve (for VB-00M)

MS + LS Port

See Options 5 and C.

Orientation of the mechanical control with respect to the ports

E : Ports oriented to the right (East)
N : Ports oriented to the front (North)
S : Ports oriented to the back (South)
W : Ports oriented to the left (West).

The installation orientation is defined by the relative position of the valve ports with respect to the conventional direction of operation of a classic vehicle, assuming that the mechanical controls are oriented as follows when idle:
Pedal: Top of pedal towards the front of the vehicle
Horizontal lever: Button towards the front of the vehicle
Vertical lever: Ball towards the front of the vehicle.

Pedal position sensor

Lever with rubber protection
**P** Customized name plate

A: Customized QR code  
B: Your company logotype  
C: Your product ID (upon request)

**L** Horizontal valve/pedal position  
Line back of the valve to top of pedal

**M** Horizontal valve/pedal position  
Line back of the valve to top of pedal
INSTALLATION

Warnings

Before Installation

Take all necessary safety precautions (people and machines) and comply with safety regulations in effect.

Confirm that mobile equipment is immobilized.

Confirm that the hydraulic system’s energy generator (motor) is stopped and electrical power is disconnected.

Lay out a safety perimeter.

Do not perform work on a hydraulic system that is hot or under pressure (discharge the accumulators).

Oil that is hot or under pressure can cause serious burns and infection. Consult a physician in case of accident.

Never heat hydraulic fluid which can ignite at high temperature. Some solvents are also inflammable.

Do not smoke while working on the system.

The valves are intended to operate in closed cabins. For applications in harsh conditions (severe weather, marine environment, etc.), please consult your Poclain Hydraulics Application Engineer.

The immediate vicinity of the machine should be declared a security zone. Observe all regulations regarding personnel safety.
General Information

Component Identification

A: Serial Number WW/YY
   WW: Week of manufacture
   YY: Year of manufacture
   This number is supplemented by a serial number that is marked by cold heading on the valve body.

B: Model code:
   e.g. VB-002-00A-00-M0-00A-4AE0

C: Poclain Hydraulics catalog number
   e.g. A23075G

D: Customer catalog number (on request)

Delivery

Valves are delivered in individual bags.

- Painted black.
- With protected openings (Plastic/metallic plugs or plates with joints for the flanges, sealing them).

Storage

The valves are supplied in bags. If they are to be stored, leave them in the bags.
If this is not possible, the valves should be kept in a dry location and protected from dust.

Storage Interval

Depending on the interval and storage conditions, it is necessary to protect the internal components of the hydraulic parts. These operations must be performed before storing components or before stopping use of the machine.

<table>
<thead>
<tr>
<th>Climate</th>
<th>Storage interval (months)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>3</td>
</tr>
<tr>
<td>Temperate</td>
<td>A</td>
</tr>
<tr>
<td>Tropical</td>
<td>B</td>
</tr>
</tbody>
</table>

Legend

A - No specific precaution; only check the proper mounting of the plugs and covers.
B - Fill up with hydraulic fluid
C - Rinse with storage fluid
D - Fill up with storage fluid.

Paint

- Use paints compatible with the existing base coat.
- The Poclain Hydraulics components (like any mechanical component) can rust. They must be effectively and regularly protected according to the environment where they are used. During installation, any trace of rust must be eliminated before painting the machine.

Primer Specifications

<table>

These specifications vary with the supplier, but meet these minima. For more information, consult your Poclain Hydraulic’s application engineer.
Circuits

Checking Connections

Piping and Connections
The different components of the hydraulic circuit (tank, pumps, distributors, filters, sinks, etc.) are connected together by rigid piping or flexible hoses.

Suggested connection: Screwed Connections

Comply with the connection directions given by the manufacturers for each part: function and marking of the ports, types of connections, diameters, types of lines (flexible or rigid), etc.

Rigid Tubes
For high-pressure pipes, only use unwelded cold-drawn steel pipes.

Take the following precautions for making up the tubes:
- After cutting to length, cold bending and crimping, the tubes must be carefully deburred, rinsed with oil and blown before connection.
- After welding or bending, the tubes must be etched (solution based on sulfuric acid) then rinsed with oil and neutralized (solution based on sodium hydroxide).
- The connections, threaded plugs, etc. must be deburred and cleaned before assembly.
- If assembly is not done immediately, seal the ports with plugs.

Flexible Tubes
Only use flexible tubes with crimped ends.

Avoid contacts likely to break down the flexible tubes. As needed protect them with armor.

Avoid kinks. Observe the minimum radius of curvature.

The tube’s interior diameter must be greater than or equal to the diameter of the connection openings of the components.

Connection

Check the compatibility of the types of connections between the tubes and the motor’s ports. If they are not compatible, use adapter fittings.

Ensure that the class of fitting is suitable for the operating pressure.
Bleed
To bleed your braking system, refer to the brake manufacturer's recommendations.

Rinse the brakes pilot circuit before connection.

Oils
Fluid Selection

General Recommendations
Poclain Hydraulics recommends the use of hydraulic fluids defined by the ISO 12922 and ISO 6743-4 standards. For temperate climates, the following types are recommended.
• HM 46 or HM 48 for fixed installations.
• HV 46 or HV 68 for mobile installations.
• HEES 46 for mobile installations.

These specifications correspond to category 91H of the CETOP standard, parts 1, 2 and 3 of the DIN 51524 standard, and grades VG32, VG 46 and VG68 of the ISO 6743-4 standards.

It is also possible to use ATF, HD, HFB, HFC or HFD type hydraulic fluid upon Poclain Hydraulics specific approval of the components' operating conditions.

Standardized designations for the fluids
• HM : Mineral fluids having specific antioxidant, anticorrosion and antiwear properties (HLP equivalent to DIN 51524 parts 1 and 2).
• HV : HM mineral fluids providing improved temperature and viscosity properties (DIN 51524 part 3).
• HEES : Biodegradable fluids based on organic esters.

Class 32 (ISO VG 32) : Viscosity of 32 cSt at 40°C.
Class 46 (ISO VG 46) : Viscosity of 46 cSt at 40°C.
Class 68 (ISO VG 68) : Viscosity of 68 cSt at 40°C.

Viscosity must always be between 9 and 500 cSt. If not, check the appropriateness of the cooling circuit, the design, or the grade of oil.
For all applications outside these limits, please consult your Poclain Hydraulics application engineer.

(a) These limits should only be taken into consideration for fluids made from hydrocracked or hydro-isomerized mineral oils.
(b) Both base fluids and additives contribute to the initial acidity index.
(c) The performance criteria or the values of properties must be the subject of negotiation between the supplier and the end user.
(d) The DIN 51777-2 standard applies in cases where interference caused by certain chemical compounds must be avoided. Free bases, oxidizing or reducing agents, mercaptans, some nitrogenous products or other products that react with iodine interfere.
(e) Not applicable to ISO 22 viscosity grade.

(a) These limits should only be taken into consideration for fluids made from hydrocracked or hydro-isomerized mineral oils.
(b) Both base fluids and additives contribute to the initial acidity index.
(c) The performance criteria or the values of properties must be the subject of negotiation between the supplier and the end user.
(d) The DIN 51777-2 standard applies in cases where interference caused by certain chemical compounds must be avoided. Free bases, oxidizing or reducing agents, mercaptans, some nitrogenous products or other products that react with iodine interfere.
(e) Not applicable to ISO 22 viscosity grade.
Temperature and Viscosity

The best performance is obtained by having the system operate in the regimes shaded gray.

<table>
<thead>
<tr>
<th>Zone</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Zone A</td>
<td>Zone of maximum efficiency. In this zone, temperature variations have a weak effect on the response time, efficiency and life expectancy of the components. Poclain Hydraulics components can operate at all speeds, pressures and powers specified in their technical documentation.</td>
</tr>
<tr>
<td>Zone B</td>
<td>High speeds can lead to vibrations and drops in mechanical efficiency. The booster pump can cavitate if the intake conditions are too tight but without risk for the system as long as the pump remains boosted. The Poclain Hydraulics components can operate at the pressures specified in their documentation but it is not advisable to use the pumps at full displacement. In a translation circuit, a rapid rise in the pump speed from zone B is allowed, but ordering the translation when the temperature has reached zone A is recommended.</td>
</tr>
<tr>
<td>Zone C</td>
<td>The efficiency is less and the use of effective antiwear additives is required. The Poclain hydraulics components can temporarily operate at a power under 20 to 50% of that stated in the technical documentation, or during 20% of the operating time at the stated power.</td>
</tr>
<tr>
<td>Zone D</td>
<td>The stated restrictions for zone B likewise apply to zone D. Further, the pumps must startup at low speed and no displacement. They must not be used in their normal operating conditions as long as the booster pressure has not stabilized and the hydraulic fluid temperature in the reservoir has not come up to zone B.</td>
</tr>
<tr>
<td>Zone E</td>
<td>The efficiency is reduced and the risk of wear on the pump and hydraulic fluid is increased. The system can operate in zone E at low-pressure and during short periods. The temperature of the hydraulic fluid in the power circuit must not be more than 10°C above the temperature of the hydraulic fluid in the reservoir, and must not be more than 20°C warmer than the hydraulic fluid in the components’ cases.</td>
</tr>
</tbody>
</table>
Water Content
The ISO 12922 standard calls for a water content \( \leq 0.05\% \).

Poclain Hydraulics components tolerate up to 0.1%.

Checking Water Content

Visual Inspection
• The oil appears cloudy once it has a water concentration greater than or equal to 1%.

We suggest two possible verification methods:

1- Quick Elementary Check

• The “crackle test.”

<table>
<thead>
<tr>
<th>Step</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>Make a small cup using household aluminum foil.</td>
<td>Put a drop of oil to test in the bottom of the cup.</td>
<td>Heat it by placing it over a flame using tongs.</td>
</tr>
</tbody>
</table>

Step 4

Action

If bubbles appear, the water content of the fluid exceeds 0.05%.

If bubbles do not appear, the water content in the fluid is less than 0.05%.

Poclain Hydraulics performs laboratory analyses of water content in fluids. Contact us for further information.

Decontamination and Filtration

It is highly advised that the hydraulic fluid is maintained at ISO standard 4406-1999 decontamination level 18/16/13 (class 7 from NAS 1638) with using a filter, in order to prevent from function degradation in time.

Max. allowed 19/17/14 (class 8 from NAS 1638) is acceptable for normal functioning of the valve, in order to assure long lasting and safe functioning of the valve during complete life time. As a consequence, internal leakage rate increase may appear in the end of life time of the valve, but without any impact on function of the valve.

The life of hydraulic components is lengthened when the contamination level is low.
Braking circuit example:

1 - Vent on the tank
2 - A 10 µm strainer on the intake line.
3 - Pump

Consult manufacturer’s instructions for components (filters, pumps, valves, etc.).

The recommended intake filter size is four-time state of the booster pump.

New fluid is generally of lower quality than our requirements. Poclain Hydraulics asks its customers to fill or adjust the levels in the reservoirs in a clean environment using a pump and filter.

Return line
It is ESSENTIAL to connect the valve return line directly to the tank.

Any counterpressure on the return line can cause premature brake wear without any use of the pedal.

Accumulators
- Select accumulators whose maximum allowable pressure is compatible with the valve pressures.
- Accumulator charging valve: any pressure on S (higher than the cut-out pressure) ends up in the accumulator(s) of the braking circuit.
Mounting

The mounting is defined for each valve type, and depends on the type of mechanical control selected.

![Warning: When the valve is installed, the pedal must not be obstructed during its stroke.]

![Warning: The valve bodies must never touch other components (min. clearance 5 mm [0.20 in]).]

Recommended screw torques:
